Cued Go/NoGo behavior
40 participants, 15,200 trials
Stage-gated RL development
actor–control model selected
for downstream evaluation
Subject-level cross-fitting
ain-fold RL fit → new-participant
latent trajectories
Action occurrence
logistic prediction
primary history → richer history
Fixed-horizon first passage
response by 700 ms + timing
rimary history → richer history
Likelihood
decomposition
event vs survival
Final inference
RL increment is modest and baseline-dependent;
first-passage gain is concentrated in response occurrence/survival
